

Head Impact Research Device

Klynton Crabbe & Callum MacKenzie

Abstract: This project focuses on improving the ability to measure the forces that act on the brain during high impact events such as contact sports. The project involves the development of sensor helmet using an innovative approach toward force measurement. Designed for use in the field for real-time data collection the device is intended for use in research related to mild traumatic brain injury (MTBI), concussions, and as a learning tool in concussion awareness programs.
